

#1 Maximizing available space.

Integrated mapping and software can provide a clearer understanding of your space and reduces the risk of building more inventory into a project than you actually have. Demolishing an old building? Using an old roadway or pathway? Now you have the visibility to do this accurately, more efficiently and with the right people in the right place at the right time.

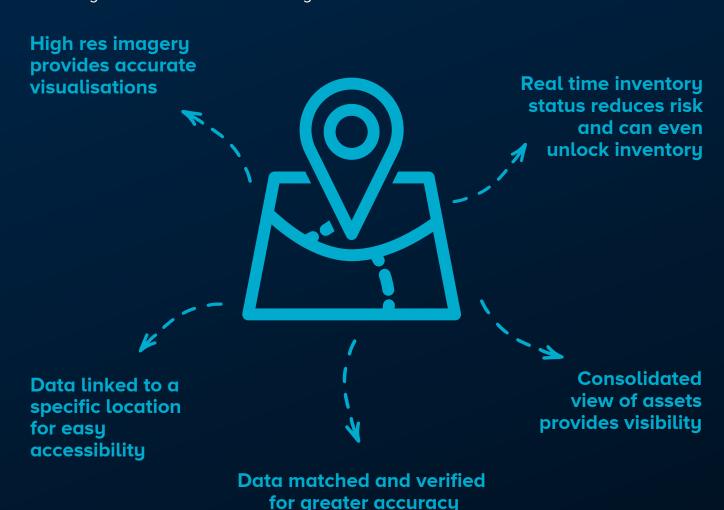

#2. Managing your inventory.

Digital maps linked to plot data can help you to clearly visualise and plan out sales of your inventory - eg. block off or put a hold on certain spaces to help control and predict the flow of sales. In fact, it can provide everything needed to manage sales processes more efficiently, providing absolute transparency for your team at every stage.

#3. Discovering untapped inventory.

Old, paper maps and ledgers don't always provide the truest picture of the inventory that you have available. A verified digital mapping process provides a forensic audit that may even unlock extra inventory for sale.

#4 Forecasting and preplanning.

When space is running out - key to making informed business decisions about the future is the ability to accurately forecast the rate at which you're running out of it - a challenge when information isn't easily accessible. Integrated digital mapping and software can provide inventory updates in real time, with reports that show accurate run rates and sales comparisons. No more trawling through endless ledgers!

#5 Better customer service.

The ability to see burial plot locations at a glance, with a heat map providing visibility of status information reduces time spent verifying available space, eliminates potential confusion over available inventory and reduces risk of double-sold plots. Ultimately...happier teams and a better experience for your families!
